

Histotripsy real-time cavitation monitor — us intrinsic-threshold (1 MHz, 30 MPa)

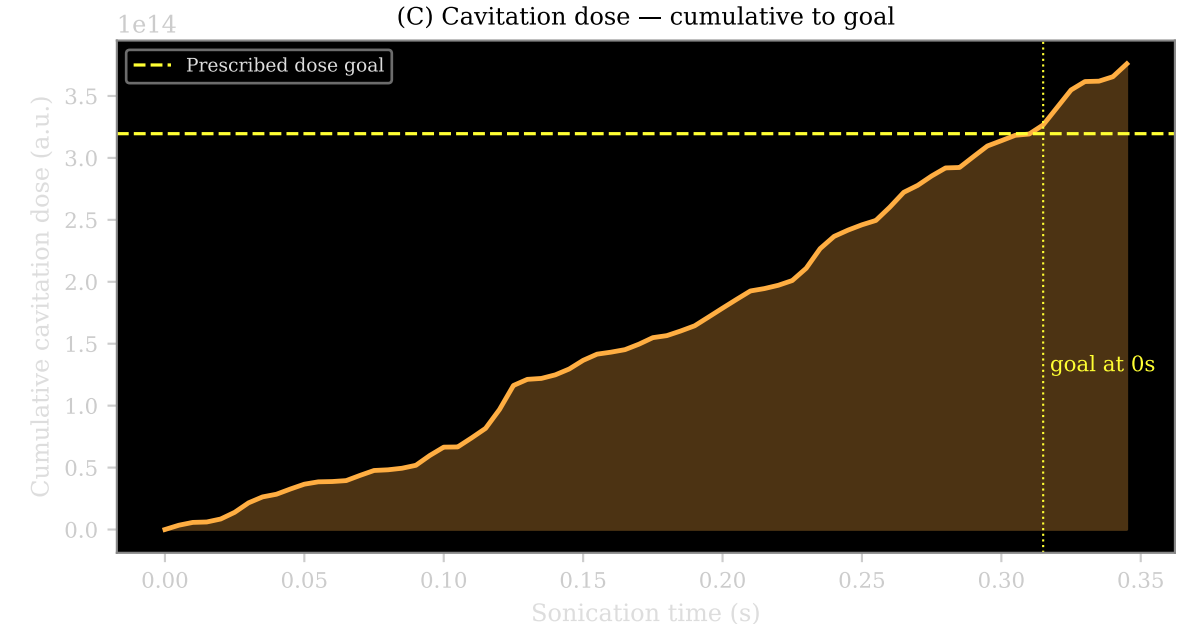

(A) Acoustic spectrum — cavitation signatures
sub/ultraharmonics = stable-cavitation markers; floor = broadband (inertial)

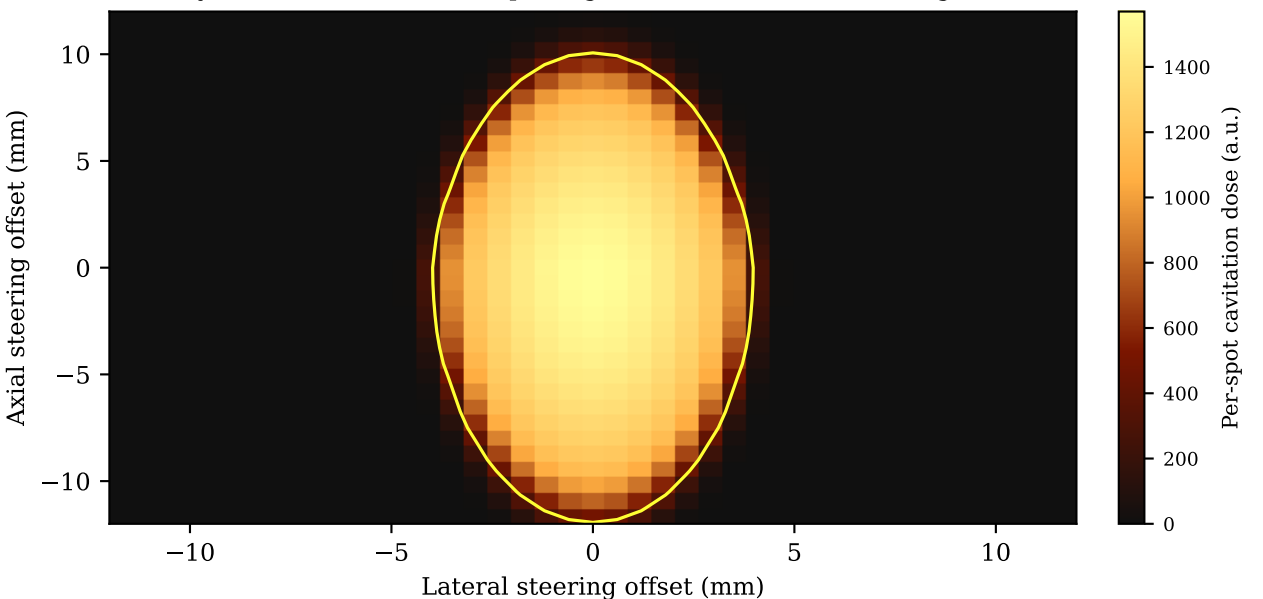

(B) Acoustic controls — live feedback
cavitation emission (orange) and applied power (green)

(C) Cavitation dose — cumulative to goal

(D) Per-subspot dose vs electronic steering + attenuation
yellow = treatable envelope ($\geq$ goal); 22% of raster reaches goal

Simulated polydisperse-population emission (short pulses $\rightarrow$ broadband-dominated); per-spot dose set by steering + liver attenuation.
